

GIS Assisted Non-Motorized Transportation Planning

2011 APA Ohio Statewide Planning Conference
Friday, October 21, 2011
10:45 AM to Noon
Norm Cox, LLA, ASLA
The Greenway Collaborative, Inc.
Ann Arbor, Michigan

THE GREENWAY COLLABORATIVE, INC.

The Purpose of GIS Assisted Network Planning

- Determine what is possible
 - Focus on near-term projects
- Help establish what is appropriate
 - Addressing roadway conditions and context
- Identify where are improvements needed the most
 - Bang for the buck
- Communication
- Sharing information

GIS as a decision support tool not a decision making tool

THE GREENWAY COLLABORATIVE, INC.

Public Input vs. Black Box

- The purpose of inventory and analysis is to help inform decisions – not make them
- Public input is just as important an input as any other analysis
- In order for any plan to get approved, it needs to have support from the public
- Should integrate public input into the GIS system

There are too many variables to use GIS in a practical cost effective way to determine an "ideal" network

THE GREENWAY COLLABORATIVE, INC.

ROW Database Conventions

- Use road centerline data for all improvements within a road ROW
- Tie to standard road referencing systems
- Use right side / left side based on line direction to record things like sidewalks
- This permits mapping sidewalks at a number of scales
- Typically use state base so we can look beyond municipal boundaries

For network planning what is important is that there is a path along side the road, the nature of the setback, the width of the path and how many driveways it crosses. The exact location of the centerline does not matter

THE GREENWAY COLLABORATIVE, INC.

Independent Trail Database Conventions

- Housed in a separate layer from the roadways
- Depth of information collected depends on the budget
- Need to at least address function – is it a true shared-use path or just a local trail or walkway?
- Status is important
 - Existing
 - Under development
 - Planned
 - Proposed

Not all shared-use paths will function the same in a transportation network

THE GREENWAY COLLABORATIVE, INC.

Intersection Database Conventions

- Point based
- Generally different databases for signalized vs. unsignalized intersections
- May be just as simple as identifying a crosswalk opportunity
- May want to collect some qualitative information – difficult to know where to stop in that regard

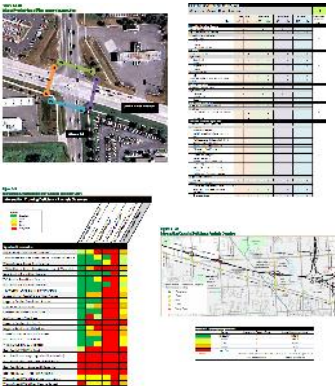

Setting up a database for an intersection can be rather complex

THE GREENWAY COLLABORATIVE, INC.

Tying GIS into Other Databases

- Some items like ADA assessments for crosswalks, a different database approach is likely warranted
- May choose to have the summary assessment in a mapable format
- Needless to say, this can get very labor intensive and expensive in a hurry

The Greenway Collaborative, Inc.

Cost Benefit

- Always ask – did we really use the data
- The inventory should be proportional to the recommendations
- Focus on those things that can be changed

Some clients / projects want a high level of analysis to help prioritize projects, others are more focused on public input

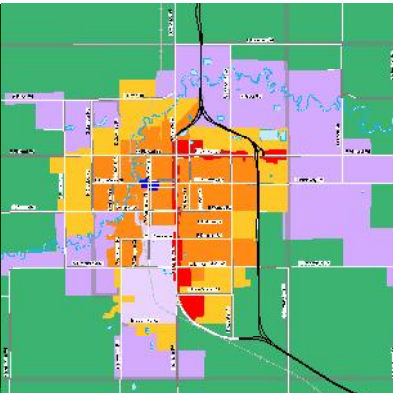

The Greenway Collaborative, Inc.

Mapping Context

- The existing and future context will inform a transportation project's design
- For long-life projects like road reconstruction and bridges must look 25+ years ahead

LANDSCAPE TYPES:

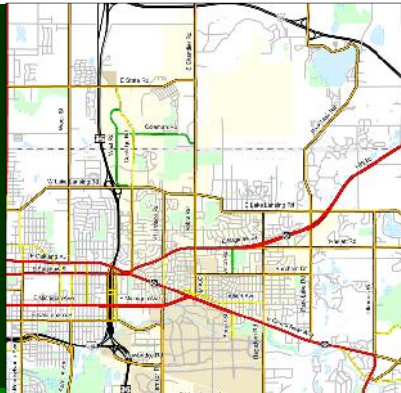

- Urban Core
- Commercial Strip
- Corridor
- Urban Fringe
- Rural Residential
- Suburban
- Suburban-Edge/Transition

The Greenway Collaborative, Inc.

National Functional Classification

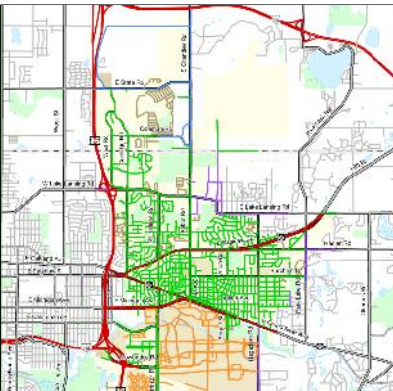

- Which roads may be more auto oriented vs. bike pedestrian oriented streets
- Typically part of state database

The Greenway Collaborative, Inc.

Road Jurisdiction

- Who has the final say on the road
- Typically part of state database

The Greenway Collaborative, Inc.

Average Daily Traffic

- Frequently regional governments are the best source for ADT data
- Sometimes this is point based and has not been distributed to segments via a model

The Greenway Collaborative, Inc.
